I am interested in pursuing staff or contract work relating to drilling, completions, production operations or well site supervision (well construction or operations)

I have a successful background of providing drilling, completions and production operations engineering service to asset teams through basins and plays in ten states and have worked as both an office engineering consultant and field supervision consultant for several companies in recent years.

I have done area research to determine successful methods, discover problem issues, best use of technology, stimulation and completion methods while drilling & completing directional and horizontal wells. I have estimated costs and risks, prepared well plans, held technical limits sessions (for both drilling and completion) and provided engineering and field oversight of both drilling and completion of new wells, plus workover and re-entry of existing wells. I have been a district production engineer for both flowing gas wells and artificial lift oil wells in CA & TX.

I would very much like to join a team or small group to assist them in their engineering and/or supervision needs, and I am flexible and open concerning travel (commuting) and compensation.

I will gladly provide my resume upon request for identified position or contract work.

Sincerely,
Randy L. Patterson, P.E.
